

Since I have experiences with react I decided to create the website using React library

And I used Codesandbox online platform to create the react app and at the end I created a github repository through Codesandbox and deployed the site on vercel.

I wanted to create a website that is better than the examples you have given. (I think having a higher target is better even if it cannot be achieved so that at least we will reach close to it) and tried to make the website as responsive as possible. I think it will work on both desktop and mobile devices without any issue. I thought of making an animation something like images flip like the way we arrange a set of playing cards. but I was not able to finish it.

I understood that having a proper plan is really important.

I did not get my hands on web development for about two months. Because of this project I revised many things like react, CSS, html semantics. I had used framer-motion, swiper libraries before but I used react-typed library for the first time in this project.

I messed up CSS but was able to fix it. It's not like I don't know CSS. I think I have less experience with how to arrange CSS code properly.
